CONNECTING STONE will test a solution in a real production quarry environment, which consists of an IIoT flexible high-quality image capturing system with immediate management and data availability in a cloud system. Designed for the primary product of “quarries-block”, the project is a keystone for implementing a global vision for innovative digitized and "intelligent" quarries. The project will work on collecting images from blocks in real-time with immediate user availability and will allow the creation of databases and inventories of existing raw materials. Therefore, CONNECTING STONE is a system for the digitization of raw materials, allowing the access to the global market and increasing the possibility of industrial technology absorption with a critical role on waste minimization towards circular economy goals.

## Vertical sector addressed

- ICT

## Challenges tackled by SMEs

- Digitalization
- Sustainable Sourcing and Circular Economy

## Key actions addressed

- KA 1
- KA 3
- KA 5

*MINE-Demo scheme*
